PRODUCT MONOGRAPH

PrVOLTAREN*
VOLTAREN* SR
(diclofenac sodium)

50 mg Enteric-Coated Tablets
75 and 100 mg Slow-Release Tablets
50 and 100 mg Suppositories

Nonsteroidal Anti-Inflammatory Drug (NSAID)

Novartis Pharmaceuticals Canada Inc.
385 boul. Bouchard
Dorval, Quebec H9S 1A9

Date of Preparation:
July 5, 1989

Date of Revision:
July 29, 2014

Control no. 170798

INDICATIONS AND CLINICAL USE

VOLTAREN* (diclofenac sodium) and VOLTAREN* SR (diclofenac sodium) are indicated for:
- the symptomatic treatment of rheumatoid arthritis and osteoarthritis, including degenerative joint disease of the hip.

Throughout this document, the term NSAIDs refers to both non-selective NSAIDs and selective COX-2 inhibitor NSAIDs, unless otherwise indicated.

Diclofenac, particularly at higher doses, is associated with an increased risk of serious cardiovascular related adverse events that is comparable to COX-2 inhibitors. For patients with pre-existing risk factors for cardiovascular disease (including ischemic heart disease, cerebrovascular disease and/or congestive heart failure NYHA II-IV) other management strategies that do not include NSAIDs, particularly COX-2 inhibitors and diclofenac, should be considered first (see CONTRAINDICATIONS and WARNINGS AND PRECAUTIONS).

For patients with increased risk of developing GI adverse events other management strategies that do not include NSAIDs should be considered first (see CONTRAINDICATIONS and WARNINGS AND PRECAUTIONS).

Use of VOLTAREN* or VOLTAREN* SR should be limited to the lowest effective dose for the shortest possible duration of treatment in order to minimize the potential risk for cardiovascular or gastrointestinal adverse events (see CONTRAINDICATIONS and WARNINGS AND PRECAUTIONS).
VOLTAREN* and VOLTAREN* SR, as NSAIDs, do NOT treat clinical disease or prevent its progression.

VOLTAREN* and VOLTAREN* SR, as NSAIDs, only relieve symptoms and decrease inflammation for as long as the patient continues to take them.

**Patients Subsets**

*Geriatrics*

Evidence from clinical studies and post-market experience suggests that use in the geriatric population is associated with differences in safety (see **WARNINGS AND PRECAUTIONS**).

*Pediatrics (<16 years of age)*

Safety and efficacy have not been established in the pediatric population.

**CONTRAINDICATIONS**

VOLTAREN* and VOLTAREN* SR are contraindicated in:

- the peri-operative setting of coronary artery bypass graft surgery (CABG). Although VOLTAREN* and VOLTAREN* SR have NOT been studied in this patient population, a selective COX-2 inhibitor NSAID studied in such a setting has led to an increased incidence of cardiovascular/thromboembolic events, deep surgical infections and sternal wound complications.
- the third trimester of pregnancy, because of risk of premature closure of the ductus arteriosus and prolonged parturition.
- women who are breastfeeding, because of the potential for serious adverse reactions in nursing infants.
- severe uncontrolled heart failure.
- known hypersensitivity to VOLTAREN* or VOLTAREN* SR or to any of the components/excipients.
- history of asthma, urticaria, or allergic-type reactions after taking ASA or other NSAIDs (i.e. complete or partial syndrome of ASA-intolerance - rhinosinusitis, urticaria/ angioedema, nasal polyps, asthma). Fatal anaphylactoid reactions have occurred in such individuals. Individuals with the above medical problems are at risk of a severe reaction even if they have taken NSAIDs in the past without any adverse reaction. The potential for cross-reactivity between different NSAIDs must be kept in mind (see **WARNINGS AND PRECAUTIONS – Hypersensitivity Reactions - Anaphylactoid Reactions**).
- active gastric / duodenal / peptic ulcer, active GI bleeding or perforation, regional ulcer, gastritis or ulcerative colitis (see **WARNINGS AND PRECAUTIONS** and **ADVERSE DRUG REACTIONS**).
- cerebrovascular bleeding or other bleeding disorders.
- inflammatory bowel disease.
- severe hepatic impairment or active liver disease.
• severe renal impairment (creatinine clearance <30 mL/min or 0.5 mL/sec) or deteriorating renal disease (individuals with lesser degrees of renal impairment are at risk of deterioration of their renal function when prescribed NSAIDs and must be monitored) (see WARNINGS AND PRECAUTIONS - Renal).
• known hyperkalemia (see WARNINGS AND PRECAUTIONS - Renal - Fluid and Electrolyte Balance).
• children and adolescents less than 16 years of age.
• suppositories are contraindicated in patients with inflammatory lesions of the rectum or anus and in patients with a recent history of rectal or anal bleeding.

WARNINGS AND PRECAUTIONS

Risk of Cardiovascular (CV) Adverse Events: Cardiovascular Disease (including ischemic heart disease, Cerebrovascular Disease, Congestive Heart Failure (NYHA II-IV))
(See WARNINGS AND PRECAUTIONS - Cardiovascular).

Diclofenac is associated with an increased risk of cardiovascular adverse events (such as myocardial infarction, stroke or thrombotic events, which can be fatal) that is comparable to COX-2 inhibitors. Meta-analyses of randomized clinical trials comparing several different NSAIDs suggest that diclofenac, particularly at higher doses, is associated with an increased risk of cardiovascular adverse events that is comparable to COX-2 inhibitors. Large population-based observational studies conducted in the general population also support these findings. The risk may increase with the dose and duration of use. Patients with cardiovascular disease or risk factors for cardiovascular disease may be at greater risk.

For patients with a high risk of developing an adverse CV event, other management strategies that do NOT include NSAIDs, particularly COX-2 inhibitors and diclofenac, should be considered first. To minimize the potential risk for an adverse CV event, the lowest effective dose should be used for the shortest possible duration.

Treatment with VOLTAREN* or VOLTAREN* SR is not recommended in patients with pre-existing cardiovascular disease (congestive heart failure NYHA II-IV, ischemic heart disease, peripheral arterial disease) cerebrovascular disease, uncontrolled hypertension or patients with risk factors for cardiovascular disease (e.g. hypertension, hyperlipidemia, diabetes mellitus and smoking). These patients should be treated with VOLTAREN* or VOLTAREN* SR only after careful consideration.

Use of NSAIDs, such as VOLTAREN* and VOLTAREN* SR, can promote sodium retention in a dose-dependent manner, through a renal mechanism, which can result in increased blood pressure and/or exacerbation of congestive heart failure (see also WARNINGS AND PRECAUTIONS - Renal - Fluid and Electrolyte Balance).
Risk of Gastrointestinal (GI) Adverse Events (See WARNINGS AND PRECAUTIONS – Gastrointestinal).

Use of NSAIDs, such as VOLTAREN* and VOLTAREN* SR, is associated with an increased incidence of gastrointestinal adverse events (such as peptic/duodenal ulceration, perforation, obstruction and gastrointestinal bleeding).

General

Frail or debilitated patients may tolerate side effects less well and therefore special care should be taken in treating this population. To minimize the potential risk for an adverse event, the lowest effective dose should be used for the shortest possible duration. As with other NSAIDs, caution should be used in the treatment of elderly patients who are more likely to be suffering from impaired renal, hepatic or cardiac function. For high risk patients, alternate therapies that do not involve NSAIDs should be considered.

Diclofenac is NOT recommended for use with other NSAIDs, with the exception of low-dose ASA for cardiovascular prophylaxis, because of the absence of any evidence demonstrating synergistic benefits and the potential for additive adverse reactions. (See DRUG INTERACTIONS - Drug/Drug Interactions - Acetylsalicylic acid (ASA) or other NSAIDs).

Diclofenac sodium should not be used concomitantly with diclofenac potassium (Pr VOLTAREN RAPIDE*) since both exist in plasma as the same active organic ion.

Carcinogenesis and Mutagenesis

(See TOXICOLOGY)

Cardiovascular

VOLTAREN* and VOLTAREN* SR are NSAIDs.

Diclofenac is associated with an increased risk of cardiovascular adverse events (such as myocardial infarction, stroke or thrombotic events, which can be fatal) that is comparable to COX-2 inhibitors. Patients with cardiovascular disease or risk factors for cardiovascular disease may be at greater risk.

As the cardiovascular risks of diclofenac may increase with dose and duration of exposure, the lowest effective daily dose should be used for the shortest duration possible. The patient's need for symptomatic relief and response to therapy should be re-evaluated periodically.

Patients should remain alert for the signs and symptoms of serious arteriothrombotic events (e.g. chest pain, shortness of breath, weakness, slurring of speech), which can occur without warnings. Patients should be instructed to see a physician immediately in case of such an event.

Use of NSAIDs, such as VOLTAREN* and VOLTAREN* SR, can lead to new hypertension or can worsen pre-existing hypertension, either of which may increase the risk of cardiovascular
events as described below. Thus blood pressure should be monitored regularly. Consideration should be given to discontinuing VOLTAREN* and VOLTAREN* SR should hypertension either develop or worsen with its use.

Use of NSAIDs, such as VOLTAREN* and VOLTAREN* SR, can induce fluid retention and edema, and may exacerbate congestive heart failure, through a renally-mediated mechanism. (See WARNINGS AND PRECAUTIONS - Renal - Fluid and Electrolyte Balance).

Caution should be exercised in prescribing VOLTAREN* and VOLTAREN* SR to patients with risk factors for cardiovascular disease, cerebrovascular disease or renal disease, such as any of the following (NOT an exhaustive list):

- Hypertension
- Dyslipidemia / Hyperlipidemia
- Diabetes Mellitus
- Congestive Heart Failure (NYHA II-IV)
- Ischemic heart disease
- Peripheral Arterial Disease
- Smoking
- Creatinine Clearance < 60 mL/min or 1 mL/sec
- Acute myocardial infarction, history of myocardial infarction and/or angina
- Stroke, cerebrovascular accident, transient ischemic attacks, and/or amaurosis fugax

If needed, these patients should be treated only after careful consideration (See WARNINGS AND PRECAUTIONS BOX).

Endocrine and Metabolism

**Corticosteroids:** VOLTAREN* and VOLTAREN* SR are NOT a substitute for corticosteroids. They do NOT treat corticosteroid insufficiency. Abrupt discontinuation of corticosteroids may lead to exacerbation of corticosteroid-responsive illness. Patients on prolonged corticosteroid therapy should have their therapy tapered slowly if a decision is made to discontinue corticosteroids (see DRUG INTERACTIONS - Drug-Drug Interactions -Glucocorticoids).

Gastrointestinal (GI)

Serious GI toxicity (sometimes fatal), such as peptic/duodenal ulceration, inflammation, perforation, obstruction and gastrointestinal bleeding, can occur at any time, with or without warning symptoms, in patients treated with NSAIDs, such as VOLTAREN* or VOLTAREN* SR. Minor upper GI problems, such as dyspepsia, commonly occur at any time. Health care providers should remain alert for ulceration and bleeding in patients treated with VOLTAREN* or VOLTAREN* SR, even in the absence of previous GI tract symptoms. Most spontaneous reports of fatal GI events are in elderly or debilitated patients and therefore special care should be taken in treating this population. To minimize the potential risk for an adverse GI event,
the lowest effective dose should be used for the shortest possible duration. For high risk patients, alternate therapies that do not involve NSAIDs should be considered (see WARNINGS AND PRECAUTIONS – Special Populations – Geriatrics).

Patients should be informed about the signs and/or symptoms of serious GI toxicity and instructed to discontinue using VOLTAREN* or VOLTAREN* SR and seek emergency medical attention if they experience any such symptoms. The utility of periodic laboratory monitoring has NOT been demonstrated, nor has it been adequately assessed. Most patients who develop a serious upper GI adverse event on NSAID therapy have no symptoms. Upper GI ulcers, gross bleeding or perforation, caused by NSAIDs, appear to occur in approximately 1% of patients treated for 3-6 months, and in about 2-4% of patients treated for one year. These trends continue, thus increasing the likelihood of developing a serious GI event at some time during the course of therapy. Even a short-term therapy has its risks.

Caution should be taken if prescribing VOLTAREN* or VOLTAREN* SR to patients with a prior history of peptic / duodenal ulcer disease or gastrointestinal bleeding as these individuals have a greater than 10-fold higher risk for developing a GI bleed when taking a NSAID than patients with neither of these risk factors. Other risk factors for GI ulceration and bleeding include the following: Helicobacter pylori infection, increased age, prolonged use of NSAID therapy, excess alcohol intake, smoking, poor general health status or concomitant therapy with any of the following:

- Anti-coagulants (e.g. warfarin)
- Anti-platelet agents (e.g. ASA, clopidogrel)
- Oral corticosteroids (e.g. prednisone)
- Selective Serotonin Reuptake Inhibitors (SSRIs) (e.g. citalopram, fluoxetine, paroxetine, sertraline)

There is no definitive evidence that the concomitant administration of histamine H2-receptor antagonists and/or antacids will either prevent or reduce the occurrence of gastrointestinal adverse events associated with the use of VOLTAREN* SR or the enteric-coated or suppository formulation of VOLTAREN*. Concurrent administration of histamine H2-receptor antagonists and/or antacids with the enteric-coated version of VOLTAREN* might result in altered absorption.

Genitourinary

Some NSAIDs are associated with persistent urinary symptoms (bladder pain, dysuria, urinary frequency), hematuria or cystitis. The onset of these symptoms may occur at any time after the initiation of therapy with an NSAID. Should urinary symptoms occur, in the absence of an alternate explanation, treatment with VOLTAREN* or VOLTAREN* SR should be stopped to ascertain if symptoms disappear. This should be done before urological investigations or treatments are carried out.
**Hematologic**

NSAIDs inhibiting prostaglandin biosynthesis interfere with platelet function to varying degrees; patients who may be adversely affected by such an action, such as those on anti-coagulants or suffering from hemophilia or platelet disorders should be carefully observed when VOLTAREN* or VOLTAREN* SR is administered.

*Anti-coagulants:* Numerous studies have shown that the concomitant use of NSAIDs and anti-coagulants increases the risk of bleeding. Concurrent therapy of VOLTAREN* or VOLTAREN* SR with warfarin requires close monitoring of the international normalized ratio (INR).

Even with therapeutic INR monitoring, increased bleeding may occur.

*Anti-platelet Effects:* NSAIDs inhibit platelet aggregation and have been shown to prolong bleeding time in some patients. Unlike acetylsalicylic acid (ASA), their effect on platelet function is quantitatively less, or of shorter duration, and is reversible.

VOLTAREN*, VOLTAREN* SR and other NSAIDs have no proven efficacy as anti-platelet agents and should NOT be used as a substitute for ASA or other anti-platelet agents for prophylaxis of cardiovascular thromboembolic diseases. Anti-platelet therapies (e.g. ASA) should NOT be discontinued. There is some evidence that use of NSAIDs with ASA can markedly attenuate the cardioprotective effects of ASA (see **Drug-Drug Interactions - Acetylsalicylic Acid (ASA) or other NSAIDs**).

Concomitant administration of VOLTAREN* or VOLTAREN* SR with low dose ASA increases the risk of GI ulceration and associated complications.

*Blood dyscrasias:* Blood dyscrasias (such as neutropenia, leukopenia, thrombocytopenia, aplastic anemia and agranulocytosis) associated with the use of NSAIDs are rare, but could occur with severe consequences.

Anemia is sometimes seen in patients receiving NSAIDs, including VOLTAREN* and VOLTAREN* SR. This may be due to fluid retention, GI blood loss, or an incompletely described effect upon erythropoiesis. Patients on long-term treatment with NSAIDs, including VOLTAREN* and VOLTAREN* SR, should have their hemoglobin or hematocrit checked if they exhibit any signs or symptoms of anemia or blood loss.

**Hepatic/Biliary/Pancreatic**

As with other NSAIDs, including VOLTAREN* or VOLTAREN* SR, borderline elevations of one or more liver enzyme tests (AST, ALT, alkaline phosphatase) may occur in up to 15% of patients. These abnormalities may progress, may remain essentially unchanged, or may be transient with continued therapy.

In post-marketing reports, cases of drug-induced hepatotoxicity have been reported in the first month, and in some cases, the first 2 months of therapy, but can occur at any time during
treatment with diclofenac. Post-marketing surveillance has reported cases of severe hepatic reactions, including liver necrosis, jaundice, fulminant hepatitis with and without jaundice, and liver failure. Some of these reported cases resulted in fatalities or liver transplantation.

Physicians should regularly monitor hepatic function in patients receiving VOLTAREN* or VOLTAREN* SR. If abnormal liver function tests persist or worsen, if clinical signs and symptoms consistent with liver disease develop (e.g. nausea, fatigue, lethargy, diarrhea, pruritus, jaundice, right upper quadrant tenderness, and «flu-like» symptoms), or if other manifestations occur (e.g. eosinophilia, associated with rash etc.), this drug should be discontinued. Hepatotoxic effects may occur with use of diclofenac without prodromal symptoms.

To minimize the possibility that hepatic injury will become severe between transaminase measurements, physicians should inform patients of the warning signs and symptoms of hepatotoxicity and the appropriate action patients should take if these signs and symptoms appear.

VOLTAREN* and VOLTAREN* SR are contraindicated in severe liver impairment or active liver disease. If there is a need to prescribe this drug to other patients with liver impairment, it must be done under strict observation.

Caution is advised when using VOLTAREN* or VOLTAREN* SR in patients with hepatic porphyria, since VOLTAREN* or VOLTAREN* SR may trigger an attack.

**Hypersensitivity reactions**

*Anaphylactoid reactions:* As with NSAIDs in general, anaphylactoid reactions have occurred in patients without known prior exposure to VOLTAREN* or VOLTAREN* SR. In post-marketing experience, rare cases of anaphylactic/ anaphylactoid reactions and angioedema have been reported in patients receiving VOLTAREN* or VOLTAREN* SR. VOLTAREN* or VOLTAREN* SR should NOT be given to patients with the ASA-triad. This symptom complex typically occurs in asthmatic patients who experience rhinitis with or without nasal polyps, or who exhibit severe, potentially fatal bronchospasm after taking ASA or other NSAIDs (see CONTRAINDICATIONS).

*ASA-intolerance:* VOLTAREN* or VOLTAREN* SR should NOT be given to patients with complete or partial syndrome of ASA-intolerance (rhinosinusitis, urticaria/angioedema, nasal polyps, asthma) in whom asthma, anaphylaxis, urticaria/angioedema, rhinitis or other allergic manifestations are precipitated by ASA or other NSAIDs. Fatal anaphylactoid reactions have occurred in such individuals. As well, individuals with the above medical problems are at risk of a severe reaction even if they have taken NSAIDs in the past without any adverse reaction (see CONTRAINDICATIONS).

*Cross-sensitivity:* Patients sensitive to any one of the NSAIDs may be sensitive to any of the other NSAIDs as well.

**Serious Skin Reactions:** (See WARNINGS AND PRECAUTIONS - Skin)
Immune

(See WARNINGS AND PRECAUTIONS - Infection - Aseptic Meningitis)

Infection

VOLTAREN* and VOLTAREN* SR, in common with other NSAIDs, may mask signs and symptoms of an underlying infectious disease.

Aseptic Meningitis: Rarely, with some NSAIDs, the symptoms of aseptic meningitis (stiff neck, severe headaches, nausea and vomiting, fever or clouding of consciousness) have been observed. Patients with autoimmune disorders (systemic lupus erythematosus, mixed connective tissue diseases, etc.) seem to be pre-disposed. Therefore, in such patients, the health care provider must be vigilant to the development of this complication.

Neurologic

Some patients may experience drowsiness, dizziness, blurred vision, vertigo, insomnia, depression, tinnitus or hearing loss with the use of NSAIDs, such as VOLTAREN* and VOLTAREN* SR. If patients experience such adverse reaction(s) they should exercise caution in carrying out activities that require alertness.

Ophthalmologic

Blurred and/or diminished vision has been reported with the use of NSAIDs. If such symptoms develop, VOLTAREN* or VOLTAREN* SR should be discontinued and an ophthalmologic examination performed. Ophthalmologic examination should be carried out at periodic intervals in any patient receiving VOLTAREN* or VOLTAREN* SR for an extended period of time.

Sun exposure in patients using VOLTAREN* or VOLTAREN* SR might cause photosensitivity and vision changes. Patients should be advised to contact their physician for assessment and advice if this occurs.

Peri-Operative Considerations

(See CONTRAINDICATIONS - Coronary Artery Bypass Graft Surgery)

Psychiatric

(See WARNINGS AND PRECAUTIONS – Neurologic)

Renal

Long term administration of NSAIDs to animals has resulted in renal papillary necrosis and other abnormal renal pathology. In humans, there have been reports of acute interstitial nephritis, hematuria, low grade proteinuria and occasionally nephrotic syndrome.
During long-term therapy, kidney function should be monitored periodically (see ACTION AND CLINICAL PHARMACOLOGY-Special Populations and Conditions-Renal Impairment).

Renal insufficiency due to NSAID use is seen in patients with pre-renal conditions leading to reduction in renal blood flow or blood volume. Under these circumstances, renal prostaglandins help maintain renal perfusion and glomerular filtration rate (GFR). In these patients, administration of a NSAID may cause a reduction in prostaglandin synthesis leading to impaired renal function. Patients at greatest risk of this reaction are those with pre-existing renal insufficiency (GFR < 60 mL/min or 1 mL/s), dehydrated patients, patients on salt restricted diets, those with congestive heart failure, cirrhosis, liver dysfunction, taking angiotensin-converting enzyme inhibitors, angiotensin-II receptor blockers, cyclosporin, diuretics, and those who are elderly. Serious or life-threatening renal failure has been reported in patients with normal or impaired renal function after short term therapy with NSAIDs. Even patients at risk who demonstrate the ability to tolerate a NSAID under stable conditions may decompensate during periods of added stress (e.g. dehydration due to gastroenteritis). Discontinuation of NSAIDs is usually followed by recovery to the pre-treatment state.

Caution should be used when initiating treatment with NSAIDs, such as VOLTAREN* or VOLTAREN* SR, in patients with considerable dehydration. Such patients should be rehydrated prior to initiation of therapy. Caution is also recommended in patients with pre-existing kidney disease.

(See WARNING AND PRECAUTIONS - Monitoring and Laboratory Tests - Renal)

Advanced Renal Disease: (See CONTRAINDICATIONS)

Fluid and Electrolyte Balance: Use of NSAIDs, such as VOLTAREN* or VOLTAREN* SR, can promote sodium retention in a dose-dependant manner, which can lead to fluid retention and edema, and consequences of increased blood pressure and exacerbation of congestive heart failure. Thus, caution should be exercised in prescribing VOLTAREN* or VOLTAREN* SR in patients with a history of congestive heart failure, compromised cardiac function, hypertension, increased age or other conditions predisposing to fluid retention (see WARNINGS AND PRECAUTIONS - Cardiovascular).

Use of NSAIDs, such as VOLTAREN* or VOLTAREN* SR, can increase the risk of hyperkalemia, especially in patients with diabetes mellitus, renal failure, increased age, or those receiving concomitant therapy with adrenergic blockers, angiotensin-converting enzyme inhibitors, angiotensin-II receptor antagonists, cyclosporin, tacrolimus, trimethoprim or some diuretics. Electrolytes should be monitored periodically (see CONTRAINDICATIONS and Drug-Drug Interactions).
**Respiratory**

ASA-induced asthma is an uncommon but very important indication of ASA and NSAIDs sensitivity. It occurs more frequently in patients with asthma who have nasal polyps.

*Pre-existing asthma:* In patients with asthma, seasonal allergic rhinitis, swelling of the nasal mucosa (i.e. nasal polyps), chronic obstructive pulmonary diseases or chronic infections of the respiratory tract (especially if linked to allergic rhinitis-like symptoms), reactions on NSAIDs like asthma exacerbations (so-called intolerance to analgesics / analgesics-asthma), Quincke’s oedema or urticaria are more frequent than in other patients. Therefore, special precaution is recommended in such patients (readiness for emergency). This is applicable as well for patients who are allergic to other substances, e.g. with skin reactions, pruritus or urticaria.

**Sexual Function / Reproduction**

The use of VOLTAREN* or VOLTAREN* SR, as with any drug known to inhibit cyclooxygenase/prostaglandin synthesis, may impair fertility and is not recommended in women attempting to conceive. Therefore, in women who have difficulties conceiving, or who are undergoing investigation of infertility, withdrawal of VOLTAREN* or VOLTAREN* SR should be considered.

**Skin**

In rare cases, serious skin reactions such as Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis and erythema multiforme have been associated with the use of some NSAIDs. Because the rate of these reactions is low, they have usually been noted during post-marketing surveillance in patients taking other medications also associated with the potential development of these serious skin reactions. Thus, causality is NOT clear. These reactions are potentially life threatening but may be reversible if the causative agent is discontinued and appropriate treatment instituted. Patients should be advised that if they experience a skin rash they should discontinue their NSAID and contact their physician for assessment and advice, including which additional therapies to discontinue.

Use of VOLTAREN* or VOLTAREN* SR may cause photosensitivity upon exposure to sunlight or UV light causing symptoms such as sunburn, skin rash, skin blisters, pruritus, erythema and discoloration.

**Special Populations**

*Pregnant Women:* VOLTAREN* or VOLTAREN* SR are CONTRAINDICATED for use during the third trimester of pregnancy because of risk of premature closure of the ductus arteriosus and the potential to prolong parturition (see TOXICOLOGY).

Caution should be exercised in prescribing VOLTAREN* and VOLTAREN* SR during the first and second trimesters of pregnancy (see TOXICOLOGY).
Inhibition of prostaglandin synthesis may adversely affect pregnancy and/or the embryofetal development. Data from epidemiological studies suggest an increased risk of miscarriage and of cardiac malformation after use of a prostaglandin synthesis inhibitor in early pregnancy.

In animals, administration of a prostaglandin synthesis inhibitor has been shown to result in increased pre- and post-implantation loss and embryo-foetal lethality. In addition, increased incidences of various malformations, including cardiovascular, have been reported in animals given a prostaglandin synthesis inhibitor during the organogenetic period. Diclofenac sodium readily crosses the placental barrier.

**Nursing Women**: (see CONTRAINDICATIONS)

**Pediatrics**: (see CONTRAINDICATIONS)

**Geriatrics**: Patients older than 65 years (referred to in this document as older or elderly) and frail or debilitated patients are more susceptible to a variety of adverse reactions from NSAIDs; the incidence of these adverse reactions increases with dose and duration of treatment. In addition, these patients are less tolerant to ulceration and bleeding. Most reports of fatal GI events are in this population. Older patients are also at risk of lower esophageal injury including ulceration and bleeding.

For such patients, consideration should be given to a starting dose lower than the one usually recommended, with individual adjustment when necessary and under close supervision.

**Monitoring and Laboratory Tests**

**Cardiovascular (Hypertension)**: Blood pressure should be monitored regularly during therapy with VOLTAREN* or VOLTAREN* SR.

**Hematologic**: Patients on long-term treatment with VOLTAREN* or VOLTAREN* SR should have their hemoglobin, hematocrit, red blood cells (RBC), white blood cells (WBC), and platelets checked if they exhibit any signs or symptoms of anemia or blood loss or blood dyscrasia.

Concurrent therapy of VOLTAREN* or VOLTAREN* SR with warfarin requires close monitoring of the international normalized ratio (INR).

**Hepatic**: Hepatic function (e.g. serum transaminases, bilirubine) should be monitored regularly during therapy with VOLTAREN* or VOLTAREN* SR.

**Ophthalmologic**: Patients on long-term treatment with VOLTAREN* or VOLTAREN* SR should have an ophthalmologic examination performed periodically, and if they experience blurred and/or diminished vision.

**Renal**: Patients with pre-existing renal insufficiency (GFR < 60 mL/min or 1 mL/s), dehydrated patients, patients on salt restricted diets, those with congestive heart failure, cirrhosis, liver dysfunction, taking angiotensin-converting enzyme inhibitors, angiotensin-II receptor blockers,
cyclosporin, diuretics, and the elderly should have their renal function monitored (e.g. urine output, serum creatinine, creatinine clearance and serum urea) during therapy with VOLTAREN* or VOLTAREN* SR.

Electrolytes, including serum potassium, should be monitored periodically, especially in patients with diabetes mellitus, renal failure, increased age, or those receiving concomitant therapy with adrenergic blockers, angiotensin-converting enzyme inhibitors, angiotensin-II receptor antagonists, cyclosporin, tacrolimus, trimethoprim or some diuretics.

ADVERSE REACTIONS

Adverse Drug Reaction Overview

Although not all adverse drug reactions have been reported with VOLTAREN* or VOLTAREN* SR (diclofenac sodium), the types of adverse drug reactions are expected to be similar to those of VOLTAREN RAPIDE* (diclofenac potassium) since both formulations exist in the plasma as the same active organic anion.

Gastrointestinal, dermatological, CNS and hepatic adverse reactions are the most commonly seen with diclofenac. The most severe gastrointestinal adverse reactions observed were ulceration and bleeding, while the most severe dermatological albeit rare reactions observed with diclofenac were erythema multiforme (Stevens-Johnson Syndrome and Lyell Syndrome). Fatalities have occurred on occasion, particularly in the elderly.

This section summarizes adverse drug reaction data pooled from clinical trials, published investigations and post-marketing experience with diclofenac potassium and diclofenac sodium.

Frequency estimate:
Very common: ≥ 10%
Common: ≥1% and <10%
Uncommon: ≥ 0.01% and < 1%
Very rare <0.01%, including isolated reports.

**Post-Market Adverse Drug Reactions**

**Hepatic:** Severe hepatic reactions including liver necrosis, fulminant hepatitis with and without jaundice, and liver failure, some of them with fatal outcome or requiring liver transplantation (see WARNINGS AND PRECAUTIONS – Hepatic/Biliary/Pancreatic).

**Cardiovascular:** Serious reactions including myocardial infarction, cardiac failure, palpitations, angina, arrhythmias, chest pain.

Meta-analysis and pharmacoepidemiological data point towards an increased risk of arteriothrombotic events associated with the use of diclofenac, particularly at a high dose (see WARNINGS AND PRECAUTIONS BOX).
DRUG INTERACTIONS

Drug-Drug Interactions

Overview

Effect of Other Drugs on the Metabolism of diclofenac: Co-prescribing diclofenac with potent CYP2C9 inhibitors could result in a significant increase in peak plasma concentrations and exposure to diclofenac due to inhibition of diclofenac metabolism. Although there are no clinical data available on the drug interaction between VOLTAREN* or VOLTAREN* SR and CYP2C9 inducers, the possibility of decreased efficacy of diclofenac resulting from concomitant administration with a CYP2C9 inducer cannot be excluded.

Drugs known to cause hyperkalemia: Concomitant treatment with potassium-sparing diuretics, cyclosporin, tacrolimus, trimethoprim, ACE inhibitors, angiotensin-II receptor antagonists or adrenergic blockers may be associated with increased serum potassium levels, which should therefore be monitored frequently (see WARNINGS AND PRECAUTIONS - Renal - Fluid and Electrolyte Balance).

Table 3 Established Potential Drug-Drug Interactions

<table>
<thead>
<tr>
<th>VOLTAREN* or VOLTAREN* SR</th>
<th>Clinical comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acetaminophen</td>
<td>There may be an increased risk of adverse renal effects when administered concomitantly with NSAIDs.</td>
</tr>
<tr>
<td>Acetylsalicylic acid (ASA) or other NSAIDs</td>
<td>The use of VOLTAREN<em>or VOLTAREN</em> SR in addition to any other NSAID, including over the counter ones (such as ASA and ibuprofen) for analgesic and/or anti-inflammatory effects is NOT recommended because of the absence of any evidence demonstrating synergistic benefits and the potential for additive adverse reactions. The exception is the use of low dose ASA for cardiovascular protection when another NSAID is being used for its analgesic/anti-inflammatory effect, keeping in mind that combination NSAID therapy is associated with additive adverse reactions. Some NSAIDs (e.g. ibuprofen) may interfere with the anti-platelet effects of low dose ASA, possibly by competing with ASA for access to the active site of cyclooxygenase-1.</td>
</tr>
<tr>
<td>Drug Class</td>
<td>Interaction</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Alcohol</td>
<td>NSAIDs or corticosteroids may increase the frequency of gastrointestinal undesirable effects. There may be an increased risk of gastrointestinal side effects, including ulceration or hemorrhage, when administered concomitantly with NSAIDs.</td>
</tr>
<tr>
<td>Antacids</td>
<td>Concomitant administration of antacids with NSAIDs may affect the rate, but generally not the extent of the absorption of the NSAID.</td>
</tr>
<tr>
<td>Anticoagulants</td>
<td>(See WARNINGS AND PRECAUTIONS – Hematologic - Anti-coagulants)</td>
</tr>
<tr>
<td>Anti-hypertensives</td>
<td>NSAIDs may diminish the anti-hypertensive effect of Angiotensin Converting Enzyme (ACE) inhibitors. Combos of ACE inhibitors, angiotensin-II antagonists, or diuretics with NSAIDs might have an increased risk for acute renal failure and hyperkalemia. Blood pressure and renal function (including electrolytes) should be monitored more closely in this situation, as occasionally there can be a substantial increase in blood pressure (see WARNINGS AND PRECAUTIONS – Renal). Therefore the combination should be administered with caution and patients, especially the elderly (see WARNINGS AND PRECAUTIONS - Monitoring and Laboratory Tests).</td>
</tr>
<tr>
<td>Anti-platelet agents (including ASA)</td>
<td>There is an increased risk of bleeding, via inhibition of platelet function, when anti-platelet agents are combined with NSAIDs, such as VOLTAREN* and VOLTAREN* SR (see WARNINGS AND PRECAUTIONS – Hematologic - Anti-platelet Effects).</td>
</tr>
<tr>
<td>Cyclosporin</td>
<td>Nephrotoxicity of cyclosporin may be increased because of the effect of NSAIDs on renal prostaglandins. Therefore, it should be given at doses lower than those that would be used in patients not receiving cyclosporin.</td>
</tr>
<tr>
<td>Digoxin</td>
<td>Diclofenac may increase the plasma concentration of digoxin. Dosage adjustment may be required. Monitoring of serum digoxin level is recommended.</td>
</tr>
<tr>
<td>Diuretics</td>
<td>Clinical studies as well as post-marketing observations have shown that NSAIDs can reduce the effect of diuretics. (see WARNINGS AND PRECAUTIONS – Renal).</td>
</tr>
<tr>
<td>Class Statement</td>
<td>Concomitant treatment with potassium-sparing diuretics may be associated with increased serum potassium, thus making it necessary to monitor levels. (see WARNINGS AND PRECAUTIONS – Monitoring and Laboratory Tests – Renal)</td>
</tr>
<tr>
<td>Glucocorticoids</td>
<td>Some studies have shown that concomitant use of NSAIDs and oral glucocorticoids increases the risk of GI adverse events such as ulceration and bleeding. This is especially the case in older (&gt;65 years of age) individuals.</td>
</tr>
<tr>
<td><strong>Lithium</strong></td>
<td>Monitoring of plasma lithium concentrations is advised when stopping or starting a NSAID, as increased lithium concentrations can occur in patients taking lithium. Dosage adjustment of lithium may be required.</td>
</tr>
<tr>
<td><strong>Methotrexate</strong></td>
<td>Caution should be exercised when NSAIDs, including VOLTAREN* or VOLTAREN* SR, are administered less than 24 hours before or after treatment with methotrexate. Elevated blood concentrations of methotrexate may occur, increasing toxicity.</td>
</tr>
<tr>
<td><strong>Oral Contraceptives</strong></td>
<td>No drug interaction data are available for VOLTAREN* or VOLTAREN* SR co-administered with oral contraceptives.</td>
</tr>
<tr>
<td><strong>Oral Hypoglycemics</strong></td>
<td>Pharmacodynamic studies have shown no potentiation of effect with concurrent administration with diclofenac; however, there are isolated reports of both hypoglycemic and hyperglycemic effects in the presence of diclofenac, which necessitated changes in the dosage of hypoglycemic agents. For this reason, monitoring of the blood glucose level is recommended as a precautionary measure during concomitant therapy.</td>
</tr>
<tr>
<td><strong>Phenytoin</strong></td>
<td>When using phenytoin concomitantly with diclofenac, monitoring of phenytoin plasma concentrations is recommended due to an expected increase in exposure to phenytoin.</td>
</tr>
<tr>
<td><strong>Probenecid</strong></td>
<td>May decrease the excretion and increase serum concentrations of NSAIDs possibly enhancing effectiveness and/or increasing potential for toxicity. Concurrent therapy of NSAIDs with probenecid requires close monitoring to be certain that no change in dosage is necessary.</td>
</tr>
<tr>
<td><strong>Quinolone antibacterials</strong></td>
<td>There have been isolated reports of convulsions which may have been due to concomitant use of quinolones and NSAIDs.</td>
</tr>
<tr>
<td><strong>Selective serotonin reuptake inhibitors (SSRIs)</strong></td>
<td>Concomitant administration of NSAIDs, including VOLTAREN* or VOLTAREN* SR, and SSRIs may increase the risk of gastrointestinal ulceration and bleeding. (see WARNINGS AND PRECAUTIONS – Gastrointestinal(GI))</td>
</tr>
<tr>
<td><strong>Sulfinpyrazone</strong></td>
<td>Caution is recommended when co-prescribing diclofenac with potent CYP2C9 inhibitors (such as sulfinpyrazone, which could result in a significant increase in peak plasma concentrations and exposure to diclofenac due to inhibition of diclofenac metabolism.</td>
</tr>
<tr>
<td><strong>Tacrolimus</strong></td>
<td>Nephrotoxicity of tacrolimus may be increased because of the effect of NSAIDs on renal prostaglandins. Therefore, it should be given at doses lower than those that would be used in patients not receiving tacrolimus.</td>
</tr>
<tr>
<td><strong>Voriconazole</strong></td>
<td>Caution is recommended when co-prescribing diclofenac with potent CYP2C9 inhibitors (such as voriconazole), which could result in a significant increase in peak plasma concentrations and exposure to diclofenac due to inhibition of diclofenac metabolism.</td>
</tr>
</tbody>
</table>
Drug-Food Interactions

Interactions with food have not been established.

Drug-Herb Interactions

Interactions with herbal products have not been established.

Drug Laboratory Tests Interactions:

Diclofenac increases platelet aggregation time but does not affect bleeding time, plasma thrombin clotting time, plasma fibrinogen, or factors V and VII to XII. Statistically significant changes in prothrombin and partial thromboplastin times have been reported in normal volunteers. The mean changes were observed to be less than 1 second in both instances, and are unlikely to be clinically important.

Persistently abnormal or worsening renal, hepatic or hematological test values should be followed up carefully since they may be related to therapy.

Drug-Lifestyle Interactions

Patients experiencing visual disturbances, dizziness, vertigo, somnolence or other central nervous system disturbances while taking VOLTAREN* or VOLTAREN* SR should refrain from driving or using machines.

DOSAGE AND ADMINISTRATION

Dosing Considerations

Geriatrics: For such patients, consideration should be given to a starting dose lower than the one usually recommended, with individual adjustment when necessary and under close supervision (See WARNINGS AND PRECAUTIONS – Special Populations - Geriatrics).

Cardiovascular disease or cardiovascular risk factors: Treatment with VOLTAREN* (diclofenac sodium) or VOLTAREN* SR is not recommended in patients with pre-existing cardiovascular disease (congestive heart failure NYHA II-IV, ischemic heart disease, peripheral arterial disease), cerebrovascular disease, uncontrolled hypertension, or patients with risk factors for cardiovascular disease (e.g. hypertension, hyperlipidemia, diabetes mellitus and smoking). These patients should be treated with VOLTAREN* or VOLTAREN* SR only after careful consideration (see WARNINGS AND PRECAUTIONS – BOX).

Renal Impairment:

VOLTAREN* or VOLTAREN* SR is contraindicated in patients with severe renal impairment or deteriorating renal disease (see CONTRAINDICATIONS). Lower doses of VOLTAREN* or VOLTAREN* SR should be considered in patients with impaired renal function (see WARNINGS AND PRECAUTIONS – Renal).
Hepatic Impairment:
VOLTAREN* or VOLTAREN* SR is contraindicated in patients with severe hepatic impairment or active liver disease (see CONTRAINDICATIONS). Lower doses of VOLTAREN* or VOLTAREN* SR should be considered in patients with impaired hepatic function (see WARNINGS AND PRECAUTIONS – Hepatic/Biliary/Pancreatic).

Recommended Dose and Dose Adjustment

VOLTAREN* and VOLTAREN* SR are to be used for maintenance therapy only.

As a general recommendation, the dose should be individually adjusted. Adverse effects may be minimized by using the lowest effective dose for the shortest duration necessary to control symptoms.

VOLTAREN* Tablets 50 mg (enteric-coated)

Rheumatoid arthritis and osteoarthritis patients may use VOLTAREN* enteric-coated tablets if:

- They were previously initiated at the lowest dose of 75 mg (enteric-coated) per day in 3 divided doses and required up-titration because they did not respond to that dose.
- The maximum recommended daily dose is 100 mg.

VOLTAREN* should be taken with food and the tablets should be swallowed whole.

VOLTAREN* SR 75 mg and 100 mg (slow-release tablets)

- Patients with rheumatoid arthritis or osteoarthritis on a maintenance dose of 75 mg diclofenac sodium per day may be changed to a once daily dose of VOLTAREN* SR 75 mg administered morning or evening.
- Patients on a maintenance dose of 100 mg diclofenac sodium per day may be changed to a once daily dose of VOLTAREN* SR 100 mg, administered morning or evening.
- The maximum recommended daily dose is 100 mg.

VOLTAREN* SR tablets should be swallowed whole with liquid, preferably at mealtime.
VOLTAREN* Suppositories

- VOLTAREN* suppositories, 50 or 100 mg, may be given as substitute for the last oral daily doses.

- The maximum recommended daily dose is 100 mg.

Missed Dose

Patients who miss one or more doses of VOLTAREN*50 mg tablets, 50 mg or 100 mg suppositories or VOLTAREN* SR 75 and 100 mg tablets should not increase the dose of VOLTAREN* or VOLTAREN* SR to compensate for the missed dose or doses, but should continue with their therapy as soon as possible.

OVERDOSAGE

For management of a suspected drug overdose, contact your regional Poison Control Center.

Symptoms

There is no typical clinical picture resulting from diclofenac overdosage. Overdosage can cause symptoms such as vomiting, gastrointestinal haemorrhage, diarrhoea, dizziness, tinnitus or convulsions. In the event of significant poisoning, acute renal failure and liver damage are possible.

Therapeutic measures

Management of acute poisoning with NSAIDs, including VOLTAREN* or VOLTAREN* SR, essentially consists of supportive measures and symptomatic treatment. Supportive measures and symptomatic treatment should be given for complications such as hypotension, renal failure, convulsions, gastrointestinal disorder, and respiratory depression. Special measures such as forced diuresis, dialysis or haemoperfusion are probably of no help in eliminating NSAIDs, including VOLTAREN* or VOLTAREN* SR, due to the high protein binding and extensive metabolism. Activated charcoal may be considered after ingestion of a potentially toxic overdose, and gastric decontamination (e.g. vomiting, gastric lavage) after ingestion of a potentially life threatening overdose.

ACTION AND CLINICAL PHARMACOLOGY

Mechanism of Action

Diclofenac sodium is a non-steroidal anti-inflammatory drug (NSAID). The mode of action is not fully known but it does not act through the pituitary-adrenal axis. Diclofenac sodium inhibits prostaglandin synthesis by interfering with the action of prostaglandin synthetase. This inhibitory effect may partially explain its actions.
Pharmacodynamics

The effects of VOLTAREN* and VOLTAREN* SR are largely mediated by inhibition of cyclooxygenases (COXs, COX-1, COX-2). These enzymes are found throughout the body and produce prostaglandins, which are important mediators of pain, fever, and adaptive and protective reactions in many organs and (inflamed) tissues.

Pharmacokinetics

Absorption: In humans, orally-administered diclofenac sodium is rapidly and almost completely absorbed and distributed to blood, liver, and kidneys. The plasma concentrations show a linear relationship to the amount of drug administered. No accumulation occurs provided the recommended dosage intervals are observed.

Enteric coating may delay the onset of absorption from 50 mg tablets. Absorption occurs more rapidly when the drug is administered on an empty stomach ($T_{\text{max}}$ 2.5 hours), than with meals ($T_{\text{max}}$ 6 hours). The bioavailability remains the same under both conditions. The mean peak plasma concentration of 1.5 μg/mL (5 μmol/L) is attained, on average, 2 hours after ingestion of one 50 mg enteric-coated tablet.

Following administration of slow-release (SR) diclofenac sodium, $C_{\text{max}}$ is reached at approximately 4 hours or later. Significant drug plasma concentrations persist when levels would have dropped almost to baseline values following enteric-coated tablet administration. Mean plasma concentrations of 13 ng/mL (40 nmol/L) were produced 24 hours after VOLTAREN* SR 100 mg, or 16 hours after VOLTAREN* SR 75 mg (single dose). Trough levels are approximately 22-25 ng/mL (70-80 nmol/L) during treatment with VOLTAREN* SR 100 once daily or VOLTAREN* SR 75 twice daily. In pharmacokinetic studies no accumulation of diclofenac sodium was found following repeated once daily administration of VOLTAREN* SR 100 mg tablets or repeated twice daily administration of VOLTAREN* SR 75 mg tablets.

Suppositories have a more rapid onset, but slower rate of absorption than oral enteric-coated tablets. $C_{\text{max}}$ is approximately 2/3 of that produced by an equivalent 50 mg enteric-coated tablet oral dose. $T_{\text{max}}$ occurs within 1 hour. The unchanged diclofenac plasma AUC values for rectal administration are within the range of values produced by equivalent oral enteric-coated tablet doses. Since about half the active substance is metabolised during its first passage through the liver ("first pass" effect), the area under the concentration curve (AUC) following oral or rectal administration is about half as large as it is following a parenteral dose of equal size.

Distribution: Diclofenac sodium is extensively bound (99%) to serum albumin. The apparent volume of distribution is 0.12 to 0.17 L/kg. Single-dose (P.O. or I.M). studies in rheumatoid patients with joint effusions have shown that diclofenac is distributed to the synovial fluid, where $T_{\text{max}}$ occurs 2 to 4 hours after plasma $T_{\text{max}}$. Synovial fluid concentrations exceed plasma levels within 4 to 6 hours of administration. This elevation above plasma concentrations can be maintained for up to 12 hours. The synovial fluid elimination half-life is at least 3 times greater than that for plasma.
Diclofenac was detected in a low concentration (100 ng/mL) in breast milk in one nursing mother. The estimated amount ingested by an infant consuming breast milk is equivalent to a 0.03 mg/kg/day dose (see **CONTRAINdications**).

**Metabolism:** Diclofenac undergoes single and multiple hydroxylation and methoxylation, producing 3'-, 4'-, 5-hydroxy, 4'- 5-hydroxy and 3'-hydroxy-4'-methoxy derivatives of diclofenac. These phenolic metabolites are largely inactive, and (along with the parent compound) are mostly converted to glucuronide conjugates.

**Excretion:** Plasma clearance of diclofenac is 263 ±56 mL/min. The mean terminal drug half-life in plasma is 1.8 hours after oral doses. In humans about 60% of the drug and its metabolites are eliminated in the urine and the balance through bile in the feces. More than 90% of an oral dose is accounted for in elimination products within 72 hours. About 1% of an oral dose is excreted unchanged in urine.

**Special Populations and Conditions**

**Renal Impairment:** In patients suffering from renal impairment, no accumulation of the unchanged active substance can be inferred from the single-dose kinetics when applying the usual dosage schedule. At a creatinine clearance of <10 mL/min, the calculated steady-state plasma levels of the hydroxy metabolites are about 4 times higher than in normal subjects. However, the metabolites are ultimately cleared through the bile. Although no accumulation of pharmacologically active substance seem to occur, caution is advised while administering VOLTAREN* or VOLTAREN* SR to patients with impaired kidney function (ie GFR < 60 mL/min or 1 mL/sec) (see **WARNINGS AND PRECAUTIONS - Renal**). VOLTAREN* and VOLTAREN* SR are contraindicated in patients with severely impaired or deteriorating renal function (creatinine clearance < 30 mL/min (0.5 mL/s) (see **CONTRAINDICATIONS**).

**Hepatic impairment:** In a study of ten patients with impaired hepatic function (chronic hepatitis and non-decompensated cirrhosis) receiving a single oral dose of 100 mg diclofenac sodium, the kinetics and metabolism of diclofenac, were the same as in patients without liver disease.

**Pediatrics:** VOLTAREN* and VOLTAREN* SR are contraindicated in children and adolescents less than 16 years of age (see **CONTRAINDICATIONS**).

**Geriatrics:** The ability of elderly subjects to absorb, metabolize and excrete VOLTAREN* or VOLTAREN* SR does not appear to differ significantly from those of younger subjects.

**STORAGE AND STABILITY**

Protect the tablets from heat (i.e., store between 15°C-30°C) and humidity.
Protect suppositories from heat (i.e., store between 15°C-30°C).

**DOSAGE FORMS, COMPOSITION AND PACKAGING**
**VOLTAREN** (diclofenac sodium) 50 mg Tablets:
Light brown, round, slightly biconvex, enteric-coated, tablets. Printed **VOLTAREN** on one side and 50 on the other. Available in bottles of 100 tablets.

**VOLTAREN** (diclofenac sodium) 75 mg Slow-Release Tablets:
Light pink, triangular, biconvex, film-coated tablets. Printed **VOLTAREN** on one side and SR 75 on the other. Available in bottles of 100 tablets.

**VOLTAREN** (diclofenac sodium) 100 mg Slow-Release Tablets:
Pink, round, biconvex, film-coated tablets. Printed **VOLTAREN SR** on one side and 100 on the other. Available in bottles of 100 tablets.

**VOLTAREN** (diclofenac sodium) 50 mg and 100 mg Suppositories:
Bullet shaped suppositories; white to yellowish-white in colour, with a smooth surface with a fat like odour. Available in cartons of 30 suppositories.

**Composition:**

**VOLTAREN** (diclofenac sodium) 50 mg enteric-coated tablets:
Each tablet contains the medicinal ingredient diclofenac sodium and non-medicinal ingredients: black ink, castor oil derivatives, colloidal silicon dioxide, corn starch, hypromellose, iron oxides, lactose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, sodium starch glycolate, talc, titanium dioxide.

**VOLTAREN** (diclofenac sodium) 75 mg SR tablets and 100 mg SR tablets:
Each tablet contains the medicinal ingredient diclofenac sodium and non-medicinal ingredients: black ink, carnauba wax, cellulose compounds, cetyl alcohol, colloidal silicon dioxide, hypromellose, magnesium stearate, polysorbate 80, povidone, red iron oxide, sucrose, talc, titanium dioxide.

**VOLTAREN** (diclofenac sodium) 50 mg and 100 mg suppositories:
Each suppository contains the medicinal ingredient diclofenac sodium and non-medicinal ingredients: semi-synthetic glycerides.
PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Drug Substance:

Proper name: Diclofenac sodium
Chemical Name: Sodium-[o-[(2,6-dichlorophenyl)-amino]-phenyl]-acetate
Molecular formula and molecular mass: C_{14}H_{10}Cl_{2}NNaO_{2} ; 318.1
Structural formula:

\[
\begin{array}{c}
\text{CH}_2\text{COO}^- \text{Na}^+ \\
\text{Cl} \quad \text{NH} \\
\text{Cl} \quad \text{Cl} \\
\end{array}
\]

Physicochemical properties: White to off-white powder with a salty bitter taste. At 25°C, diclofenac sodium is 2% soluble in water (pH 7.7). It is practically insoluble in aqueous acidic solutions.

CLINICAL TRIALS

Randomized clinical trials with VOLTAREN* and VOLTAREN* SR have NOT been designed to detect differences in cardiovascular adverse events in a chronic setting.

However, large population-based observational studies, meta-analyses and systematic reviews suggest that diclofenac use is associated with an increased risk of cardiovascular thrombotic events, including myocardial infarction and ischemic stroke. Results of some studies suggest that the CV risk is related to the dose and duration of diclofenac exposure and is greater in patients with risk factors for CV disease.

Large meta-analyses of randomized clinical trials show that diclofenac is associated with an increased risk of stroke, cardiovascular death, and death from any cause when compared with placebo. Data also suggest that diclofenac, particularly when used at a high dose (150 mg daily) may have a higher risk of thrombotic CV events than other NSAIDs.
The information provided below supported the original registration and its subsequent amendments. These studies were conducted in accordance with the standards and regulations in force at the time of conduct of these studies.

**Enteric coated tablets**

The therapeutic safety and efficacy of VOLTAREN* in arthritic conditions has been investigated in both short and long-term (three months) controlled clinical studies, followed by extended controlled and non-controlled studies. The majority of the comparative studies were double blind, within patient or between patient design, using placebo and indomethacin as controls. Acetylsalicylic acid (ASA), ibuprofen, phenylbutazone and acetaminophen were also used as comparative standards.

At time of approval, the safety and efficacy of VOLTAREN* for relief of the signs and symptoms of osteoarthritis and rheumatoid arthritis was demonstrated in short-term prospective comparative clinical trials conducted in 105 patients with osteoarthritis and 654 patients with rheumatoid arthritis. The controls used in these trials included: indomethacin, acetylsalicylic acid, acetaminophen and ibuprofen.

Several of the long-term double-blind, between patient studies comparing a three times daily dosing of VOLTAREN* to that of indomethacin were of three months duration. Patients received either drug at dosages ranging from 50 to 125 mg. In the treatment of patients with rheumatoid arthritis there was no clear difference between the treatment groups for therapeutic effect.

The safety and efficacy of VOLTAREN* compared to indomethacin for relief of the signs and symptoms of rheumatoid arthritis was also studied in longer-term studies of 6 to 30 months.

**Slow release tablets**

Bioavailability studies have demonstrated that the absorption of active drug from the VOLTAREN* slow release (SR) tablets is similar as that reported from the VOLTAREN* enteric coated tablets with the $C_{\text{max}}$ being attained approximately four hours after the administration of a single 100 mg VOLTAREN* SR tablet. Repeated administration of the VOLTAREN* SR tablets for seven days or longer did not result in any accumulation of active drug and food intake did not alter absorption from the VOLTAREN* SR tablet.

A regimen of multiple doses of the 75 mg VOLTAREN* SR tablet (every 12 hours) provided an equivalent AUC$_{0-24}$ to that of the 50 mg VOLTAREN* enteric coated tablet dosed every eight hours; an indication that the 75 mg VOLTAREN* SR tablet is an effective and desirable alternate to the 50 mg VOLTAREN* enteric coated tablet for the treatment of rheumatoid arthritis or osteoarthritis.

Safety and efficacy of VOLTAREN* SR 100 mg tablets were demonstrated in a randomized, double-blind, parallel, short-term (two weeks) clinical study when compared to VOLTAREN* enteric coated tablets and placebo in patients suffering from adult onset rheumatoid arthritis.
second comparative clinical trial was conducted in patients with established osteoarthritis of the hip and knee. No statistically significant differences were seen between the 2 VOLTAREN* regimens.

**Suppositories**

The compilation of data to compare the bioavailability of diclofenac sodium from various dosage forms (enteric coated tablets and suppositories) has shown that the time to $C_{\text{max}}$ following the administration of the suppository was slightly shorter (0.5 to 2 hours) than that observed for the VOLTAREN* enteric coated tablet (1 to 3 hours) and that the $\text{AUC}_{(\text{corr})}$ values of unchanged diclofenac sodium were directly proportional to the doses administered, irrespective of the dosage form used.

Seventy-five percent or more of patients suffering from osteoarthritis who received a once daily dose regimen of 100 mg VOLTAREN* or indomethacin as suppositories reported improved symptoms or became symptom free after one week of treatment. There were no significant differences in the treatment efficacy between treatment regimens.

**DETAILED PHARMACOLOGY**

Diclofenac sodium is a phenyl-acetic acid derivative possessing anti-inflammatory activities as shown in various pharmacological models.

*In vitro* diclofenac sodium does not suppress proteoglycan biosynthesis in cartilage at concentrations equivalent to the concentrations reached in humans.

**Anti-Inflammatory Activity in Rats**

The anti-inflammatory potency was assessed by testing inhibition of paw edema (carrageenin solution and kaolin suspension) and reduction of adjuvant arthritis (Freund's adjuvant).

*determined by graphic interpolation from 3 or more doses.

**Inhibition of Prostaglandin**

A close correlation exists between certain febrile reactions and increased prostaglandin levels in the brain. Diclofenac (0.5 µg/mL) reduces prostaglandin E\textsubscript{2} formation which parallels antipyresis but does not induce hypothermia in the afebrile animal. The inhibition of prostaglandin synthesis in vitro (IC\textsubscript{50} µM/L) is 1.6.

**Platelet Adhesiveness**

At 15 µg/mL, diclofenac reduces collagen-induced aggregation in rabbit platelets by 50%. ADP-induced adhesiveness at the same dosage is similarly affected. At 10 mg/kg P.O., diclofenac protected rabbits against the lethal action of thrombokinase without untoward effects.

**Gastrointestinal Tolerability**

In rats, oral doses of 17 mg/kg diclofenac sodium caused a blood loss of 150 µL in 72 hours, as measured by the administration of \textsuperscript{51}Cr-labelled erythrocytes.

Diclofenac sodium was given orally to male and female rats in doses of 0.25, 1.0 and 2.0 mg/kg/day from 59 weeks (high-dose groups) to 98 weeks (low- and intermediate-dose groups). High dose-related mortality rates resulted in termination of the high-dose administration after 59 weeks; the high mortality rate was caused by severe dose-dependent ulceration of the gastrointestinal tract, with perforated ulcers leading to peritonitis and sequelae. Body-weight gains and feed consumption of the treated groups were close to the controls. Hematologic patterns showing neutrophilic leucocytosis and anemia were seen in the high- and intermediate-dose groups, particularly females at weeks 52 and 98, respectively. Female animals tended to develop enlarged adrenals and eventually experienced depressed glucose and elevated alkaline phosphatase levels. Histology studies carried out on the tissues of the control, low- and intermediate-dose groups showed drug-related changes including mucosal ulceration of the small intestine, lymphangiectasis, lymphoid hypoplasia, and plasma cell hypoplasia of the mesenteric lymph nodes, foci of hepatocytic hyperplasia, adrenal cortical atrophy and prostatitis. No increase in tumour incidence was observed in the drug-treated groups as compared to the control group.

Diclofenac sodium was administered orally in gelatin capsules once daily to baboons (*Papio spp.*) at dose levels of 0, 5, 15 (reduced to 10 on day 254) and 50 (reduced to 30 on day 38) mg/kg/day for up to 52 weeks. At all dose levels studied, diclofenac caused ulceration of the gastrointestinal tract. Ulceration was confined to the colon in the low-dose group but was present in the stomach and small intestine also in the other two groups. Body weights were below controls. Constipation, with occasional episodes of diarrhea, was a marked feature. In all treated groups, there was a dose-related fall in serum albumin levels. Anemia and an increased ESR were observed in the high-dose group. In the recovery groups (control, low, and intermediate), no intestinal lesions were present. Food consumption and body-weight gains were within normal limits. Hematology parameters were comparable to controls and serum albumin levels returned towards normal values.
Reproduction Studies

**Rats:** Doses of 2 and 4 mg/kg/day were given orally to male and female rats with no noticeable effect on fertility. Dosing was carried out during premating, mating, gestation, and lactation periods. At the higher dose, prolonged gestation and dystocia were observed. Embryotoxicity (low birth weight, failure to survive) was observed at both doses but it was minimal at 2 mg/kg/day. Post-natal survival and growth of pups from drug-treated animals were comparable to those of controls except for slightly retarded growth at the higher dose.

**Mice and Rats:** Teratology studies at oral doses of 2, 3, 10, and 20 mg/kg/day showed no teratogenic effects on fetuses. At the higher doses, pronounced gastrointestinal effects were observed in the dams and a marked toxic effect noted in fetuses (reduced birth weights and increased fetal deaths).

**Rabbits:** Pregnant females treated with oral doses of 5 or 10 mg/animal/day throughout the gestation period showed a dose-dependent increase in resorption rates, diminished fetus weights, and abnormal skeletal findings. Definite embryotoxicity was observed at the highest dose although there was no evidence to suggest teratogenicity.

Administration of NSAIDs (including diclofenac) inhibited ovulation in the rabbit and implantation and placentation in the rat, and led to premature closure of the ductus arteriosus in the pregnant rat. Maternally toxic doses of diclofenac were associated with dystocia, prolonged gestation, decreased fetal survival, and intrauterine growth retardation in rats. The slight effects of diclofenac on reproduction parameters and delivery as well as constriction of the ductus arteriosus in utero are pharmacologic consequences of this class of prostaglandin synthesis inhibitors (see CONTRAINDICATIONS and WARNINGS AND PRECAUTIONS - Special Populations).

Mutagenicity Studies

Mutagenicity studies were carried out in vitro using bacteria with, and without microsomal activation, and in mammalian cells. Studies in vivo were also performed. Diclofenac sodium was not mutagenic in any of these test systems.

Carcinogenicity Studies

Long-term carcinogenicity studies in rats given diclofenac sodium up to 2 mg/kg/day have revealed no significant increases in tumour incidence. There was a positive dose-related trend with respect to adrenal medullary hyperplasia, mammary fibroadenomas and subcutaneous tissue fibromas in females, as well as of C-cell adenomas of the thyroid in males. The differences in the incidence between the various groups, including control, were small and were considered to reflect the variation in the spontaneous occurrence of these incidental lesions, common in old laboratory rats.

In a 2-year mouse study, only controls and animals at the two lower daily doses of 0.1 and 0.3 mg/kg showed survival sufficient for assessment of carcinogenic potential. The two higher
daily doses of 1 and 2 mg/kg resulted in a shortening of lifespan, particularly in males, as a consequence of ulceration and/or perforation of the small intestine and therefore prevented evaluation. The known susceptibility of rodents to non-steroidal anti-inflammatory drugs, resulting in high mortality at dose levels close to the therapeutic dose, is considered to be a rodent-specific effect. Diclofenac sodium was not carcinogenic to mice under the conditions of this study.

PART III CONSUMER INFORMATION

Pr VOLTAREN*  
Pr VOLTAREN* SR  
(diclofenac sodium)

Read this information each time you refill your prescription in case new information has been added.

This leaflet is Part III of a three-part "Product Monograph" published when VOLTAREN* and VOLTAREN*SR were approved for sale in Canada and is designed specifically for Consumers. This leaflet is a summary and will NOT tell you everything about VOLTAREN* or VOLTAREN*SR. Contact your doctor or pharmacist if you have any questions about the drug.

ABOUT THIS MEDICATION

What the Medication is used for:
Your health care provider has prescribed VOLTAREN* or VOLTAREN* SR for you to relieve pain and swelling in rheumatoid arthritis and osteoarthritis, including degenerative joint disease of the hip.

What it does:
VOLTAREN* and VOLTAREN* SR (diclofenac sodium), as nonsteroidal anti-inflammatory drugs (NSAIDs), can reduce the chemicals prostaglandins produced by your body which cause pain and swelling. VOLTAREN* and VOLTAREN* SR, as nonsteroidal anti-inflammatory drugs (NSAIDs) do NOT cure your illness or prevent it from getting worse. VOLTAREN* or VOLTAREN* SR can only relieve pain and reduce swelling as long as you continue to take it.

When it should not be used:

• Currently breastfeeding (or planning to breastfeed)
• Allergy (hypersensitivity) to diclofenac sodium, or ASA (Acetylsalicylic Acid) or other NSAIDs (Nonsteroidal Anti-Inflammatory Drugs), or any of the nonmedicinal ingredients in VOLTAREN* or VOLTAREN*SR
• Ulcer (active)
• Bleeding or perforation from the stomach or gut (active)
• Inflammatory bowel disease (Crohn’s Disease or Ulcerative Colitis)
• Liver disease (active or severe)
• Kidney disease (severe or worsening)
• High potassium in the blood

Do not use VOLTAREN* suppositories if you have inflammation of the rectum or anus or have a recent history of bleeding from the rectum or anus.

Patients who took a drug in the same class as VOLTAREN* and VOLTAREN* SR after a type of heart surgery (coronary artery bypass grafting (CABG)) were more likely to have heart attacks, strokes, blood clots in the leg(s) or lung(s), and infections or other complications than those who did NOT take that drug.

VOLTAREN* and VOLTAREN* SR should NOT be used in patients under 16 years of age since the safety and effectiveness have NOT been established.

What the medicinal ingredient is:
diclofenac sodium.

What the non-medicinal ingredients are:
The enteric coated 50 mg tablets (VOLTAREN*) contain black ink, castor oil derivatives, colloidal silicon dioxide, corn starch, hypromellose, iron oxides, lactose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, sodium starch glycolate, t alc, titanium dioxide.

The slow-release 75 mg and 100 mg tablets (VOLTAREN* SR) contain black ink, carnauba wax, cellulose compounds, cetyl alcohol, colloidal silicon dioxide, hypromellose magnesium stearate, polysorbate 80, povidone, red iron oxide, sucrose, t alc, titanium dioxide.

The 50 mg and 100 mg suppositories contain semi-synthetic glycerides.
What dosage forms it comes in:

VOLTAREN* 50 mg (enteric-coated) tablet: light brown, round, VOLTAREN on one side and 50 on the other.

VOLTAREN* 75 mg Slow Release (SR) tablet: light pink, triangular, VOLTAREN on one side and SR 75 on the other.

VOLTAREN* 100 mg Slow Release (SR) tablet: pink, round, VOLTAREN SR on one side and 100 on the other.

VOLTAREN* 50 mg and 100 mg Suppositories: Bullet shaped, white to yellowish-white colour, with a smooth surface with a fat like odour.

Check with your pharmacist if the identifying markings or colour appear different.

WARNINGS AND PRECAUTIONS

If you have, or previously had, any of the following conditions, see your health care provider to discuss treatment options other than VOLTAREN* or VOLTAREN* SR:

• Heart Attack or Angina
• Stroke or Mini-stroke
• Loss of Vision
• Current Pregnancy (less than 28 weeks)
• Congestive Heart Failure
• High blood pressure
• Diabetes
• High levels of fats in your blood
• Smoking

It is important to take the lowest dose of VOLTAREN* and VOLTAREN* SR that relieves your pain and/or swelling and for the shortest time possible in order to keep your risk of side effects on the heart and blood vessels as small as possible.

Use of NSAIDs, such as VOLTAREN* and VOLTAREN*SR can result in increased blood pressure and/or worsening of congestive heart failure.

Use of NSAIDs, such as VOLTAREN* and VOLTAREN* SR, may cause stomach and bowel problems (such as ulceration, perforation, obstruction and bleeding).

Before taking this medication, tell your health care provider if you have any of the following:

• Disease of the heart or blood vessels (also called cardiovascular disease, including uncontrolled high blood pressure, congestive heart failure, established ischemic heart disease, or peripheral arterial disease), as treatment with VOLTAREN* and VOLTAREN* SR in these cases is not recommended.
• Risk factors for cardiovascular disease (see above) such as high blood pressure, abnormally high levels of fat (cholesterol, triglycerides) in your blood, diabetes, or if you smoke.
• Diabetes mellitus or on a low sugar diet
• Atherosclerosis
• Poor circulation to your extremities
• Kidney disease or urine problems
• Previous ulcer or bleeding from the stomach or gut
• Previous bleeding in the brain
• Bleeding problems
• Family history of allergy to NSAIDs, such as acetylsalicylic acid (ASA), celecoxib, diclofenac, diflunisal, etodolac, fenoprofen, flurbiprofen, ibuprofen, indomethacin, ketoprofen, ketorolac, mefenamic acid, meloxicam, nabumetone, naproxen, oxaprozin, piroxicam, rofecoxib, sulindac, tenoxicam, tiaprofenic acid, tolfmetin, or valdecoxib (NOT a complete list)
• Family history of asthma, nasal polyps, long-term swelling of the sinus (chronic sinusitis) or hives

Also, before taking this medication, tell your health care provider if you are planning to get pregnant.

While taking this medication:

• Tell any other doctor, dentist, pharmacist or other health care professional that you see, that you are taking this medication, especially if you are planning to have heart surgery;
• Do NOT drink alcoholic beverages while taking this medication because you would be more likely to develop stomach problems;
• Fertility may be decreased. The use of VOLTAREN* or VOLTAREN* SR is not recommended in women trying to get pregnant. In women who have difficulty conceiving, stopping VOLTAREN* or VOLTAREN* SR should be considered.
• If you have cardiovascular disease or risks for cardiovascular disease, your doctor will periodically re-evaluate whether you should continue treatment with VOLTAREN* or VOLTAREN* SR.
• Your doctor will monitor your kidney function, your liver function and your blood count to decide if VOLTAREN* or VOLTAREN* SR
needs to be discontinued or if the dose needs to be changed.

If, at any time while taking VOLTAREN* or VOLTAREN* SR you experience any signs or symptoms of problems with your heart or blood vessels such as chest pain, shortness of breath, weakness, or slurring of speech, contact your doctor immediately.

Long-term use of VOLTAREN* or VOLTAREN* SR might increase the risk of heart attacks or strokes.

VOLTAREN* or VOLTAREN* SR is NOT recommended for use in patients under 16 years of age since safety and effectiveness have NOT been established.

INTERACTIONS WITH THIS MEDICATION

What About Taking Other Drugs At The Same Time?

See your health care provider and pharmacist if you are taking any other medication (prescription or non-prescription) such as any of the following (NOT a complete list):
- Acetaminophen
- Acetylsalicylic Acid (ASA) or other NSAIDs e.g. ASA, celecoxib, diclofenac, ibuprofen, indomethacin, ketorolac, meloxicam, naproxen
- Alcohol
- Antacids
- Anti-depressants
- Selective Serotonin Reuptake Inhibitors (SSRIs) e.g. citalopram, fluoxetine, paroxetine, sertraline
- Blood pressure medications
  - ACE (angiotensin converting enzyme) inhibitors e.g. enalapril, lisinopril, perindopril, ramipril
  - ARBs (angiotensin II receptor blockers) e.g. candesartan, irbesartan, losartan, valsartan
  - Beta-blockers e.g. metoprolol
- Blood thinners (medicine used to prevent blood-clotting) e.g. warfarin, ASA, clopidogrel
- Corticosteroids (including glucocorticoids) (medicines used to provide relief for inflamed areas of the body) e.g. prednisone
- Cyclosporin (a medicine primarily used in patients who have received organ transplants)
- Digoxin (a medicine used for heart problems)
- Diuretics (medicines used to increase the amount of urine)
  - e.g. furosemide, hydrochlorothiazide
  - Lithium
  - Methotrexate (a medicine used to treat some kinds of cancer or arthritis)
  - Oral hypoglycemics (diabetes medications)
  - Phenytoin (a medicine used to treat seizures).
  - Probenecid
  - Quinolone antibacterials (medicines used against infection)
  - Sulfipyrazone (a medicine used to treat gout)
  - Tacrolimus (a medicine primarily used in patients who have received organ transplants)
  - Trimethoprim (a medicine used to prevent or treat urinary tract infection)
  - Voriconazole (a medicine used to treat fungal infections)

Your health care provider may prescribe low dose ASA (acetylsalicylic acid) as a blood thinner to reduce your risk of having a heart attack or stroke while you are taking VOLTAREN* or VOLTAREN* SR. Take only the amount of ASA prescribed by your health care provider. You are more likely to upset or damage you stomach if you take both VOLTAREN* or VOLTAREN* SR and ASA than if you took VOLTAREN* or VOLTAREN* SR alone.

PROPER USE OF THIS MEDICATION

VOLTAREN* and VOLTAREN SR* is used for maintenance therapy only.

Usual Dose for patients 16 years of age and older:

</table>
Take VOLTAREN* or VOLTAREN* SR only as directed by your health care provider. Do NOT take more of it, do NOT take it more often and do NOT take it for a longer period of time than your health care provider recommended. If possible, you should take the lowest dose of this medication for the shortest time period. Taking too much VOLTAREN* or VOLTAREN* SR may increase your chances of unwanted and sometimes dangerous side effects, especially if you are elderly, have other diseases or take other medications.

If you will be using VOLTAREN* or VOLTAREN* SR for more than 7 days, see your health care provider regularly to discuss whether this medicine is working for you and if it is causing you any unwanted effects.

Swallow the tablet whole with water, do not chew or divide the tablet. It is best to take your dose at the same time each day.

To help reduce the possibility of stomach upset you should take VOLTAREN* or VOLTAREN* SR tablets immediately after a meal or with food or milk. Also, you should remain standing or sitting upright (i.e. do not lie down) for about 15-30 minutes after taking the medicine. This helps to prevent irritation that may lead to trouble swallowing. If stomach upset (indigestion, nausea, vomiting, stomach pain or diarrhea) occurs and continues, contact your doctor.

Using Suppositories
VOLTAREN* suppositories (50 and 100 mg) are wrapped in a plastic film. Make sure that the plastic wrapping is fully removed before inserting the suppository into the rectum. It is best to take the suppositories after emptying your bowels.

Do not take suppositories by mouth.

This medication has been prescribed specifically for you. Do NOT give it to anyone else. It may harm them, even if their symptoms seem to be similar to yours.

Missed dose:

If you forget to take your scheduled dose, you should not double the next scheduled dose to make up for the missed dose.

Overdose:

If you have accidentally taken more than the prescribed dose of VOLTAREN* tablets, suppositories or VOLTAREN* SR tablets, contact your doctor, pharmacist or poison control centre immediately or go to the hospital emergency unit at once. You may require medical attention.

SIDE EFFECTS AND WHAT TO DO ABOUT THEM

VOLTAREN* or VOLTAREN* SR may cause some side effects, especially when used for a long time or in large doses. When these side effects occur, you may require medical attention. Report all symptoms or side effects to your health care provider.

VOLTAREN* or VOLTAREN* SR may cause you to become drowsy or tired. Be careful about driving or participating in activities that require you to be alert. If you become drowsy, dizzy or light-headed after taking VOLTAREN* or VOLTAREN* SR, do NOT drive or operate machinery.

VOLTAREN* or VOLTAREN* SR may cause you to become more sensitive to sunlight. Any exposure to sunlight or sunlamps may cause sunburn, skin blisters, skin rash, redness, itching or discolouration, or vision changes. If you have a reaction from the sun, check with your health care provider.

Check with your health care provider IMMEDIATELY if you develop chills, fever, muscle aches or pains, or other flu-like symptoms, especially if they occur before or together with a skin rash. These symptoms may be the first signs of a SERIOUS ALLERGIC REACTION to this medication.

This is NOT a complete list of side effects. If you develop any other symptoms while taking VOLTAREN* and/or VOLTAREN* SR, see your health care provider.

### HOW TO STORE IT

Protect tablets from heat (i.e., store at temperatures between 15°C-30°C) and humidity.

Protect suppositories from heat (i.e., store at temperatures between 15°C-30°C).

Do NOT keep outdated medicine or medicine no longer needed. Any outdated or unused medicine should be returned to your pharmacist.

Keep this and all medication out of the reach of children.

### REPORTING SUSPECTED SIDE EFFECTS
REPORTING SUSPECTED SIDE-EFFECTS
You can report any suspected adverse reactions associated with the use of health products to the Canada Vigilance Program by one of the following 3 ways:

- Report online at www.healthcanada.gc.ca/medeffect
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and:
  - Fax toll-free to 1-866-678-6789, or
  - Mail to: Canada Vigilance Program
    Health Canada
    Postal Locator 0701E
    Ottawa, ON K1A 0K9

Postage paid labels, Canada Vigilance Reporting Form and the adverse reaction reporting guidelines are available on the MedEffect™ Canada Web site at www.healthcanada.gc.ca/medeffect.

NOTE: Should you require information related to the management of side effects, contact your health professional. The Canada Vigilance Program does not provide medical advice.
